

FIG. 104.—Bronchus showing the extension of inflammation through the tissue between the cartilages, with desquamation of the epithelium, in a case of streptococcus lobular pneumonia. The epithelium is thickened by proliferation, as seen in cases associated with influenza bacillus infection, which may have preceded the streptococcus infection. Accession number 16590, Army Medical Museum. Negative number 45236. Hematoxylin and eosin stain;  $\times 32$
