

FIG. 302.—Muscle fibers separated by gas and exudate. This area was near the wound tract and shows a marked leucocyte infiltration, as well as a large amount of gas. There are marked chemical changes in muscle fibers, as evidenced by the marked variation in the way in which they take the stain. One fiber in the upper central area contains a relatively large gas bubble. Accession number 4709, Army Medical Museum. Negative number 46172. MacCallum stain; $\times 200$
