

FIG. 34.—Small arteriole between alveolar ducts; showing a ring of mononuclear cells which have apparently proliferated from the cells of the adventitia or arrived by migration through the vessel wall. The apparent attachment of some of them to the tissue suggests the adventitia of the vessel as the probable point of origin of these cells. Accession number 1049, Army Medical Museum. Negative number 45672. Weigert iron hematoxylin and picro-eosin stain; $\times 515$
