

FIG. 41.—Peribronchiolar lesions in pneumonia following influenza. It is in this type of lesion that small Gram-negative bacilli most frequently are found. Streptococci were found in the bronchioles not far from these areas and in the interstitial tissue around the larger vessel seen in one corner of the illustration. Accession number 2694, Army Medical Museum. Negative number 45995. Hematoxylin and eosin stain;  $\times 19$
