

FIG. 42.—Pneumonia following influenza. Peribronchiolar nodular consolidations, with some spreading out of the lesion from the bronchioles so that a few lobules are filled with exudate. Considerable interstitial lymphangitis near the base of the lower lobe, with slight thickening of the interlobular septa and peribronchial tissue throughout the lung. Gram-negative organisms were present in sections of the peribronchiolar lesions; *Streptococcus hemolyticus* was cultivated from the areas of lymphangitis. Accession number 3036, Army Medical Museum. Negative number 42866
