
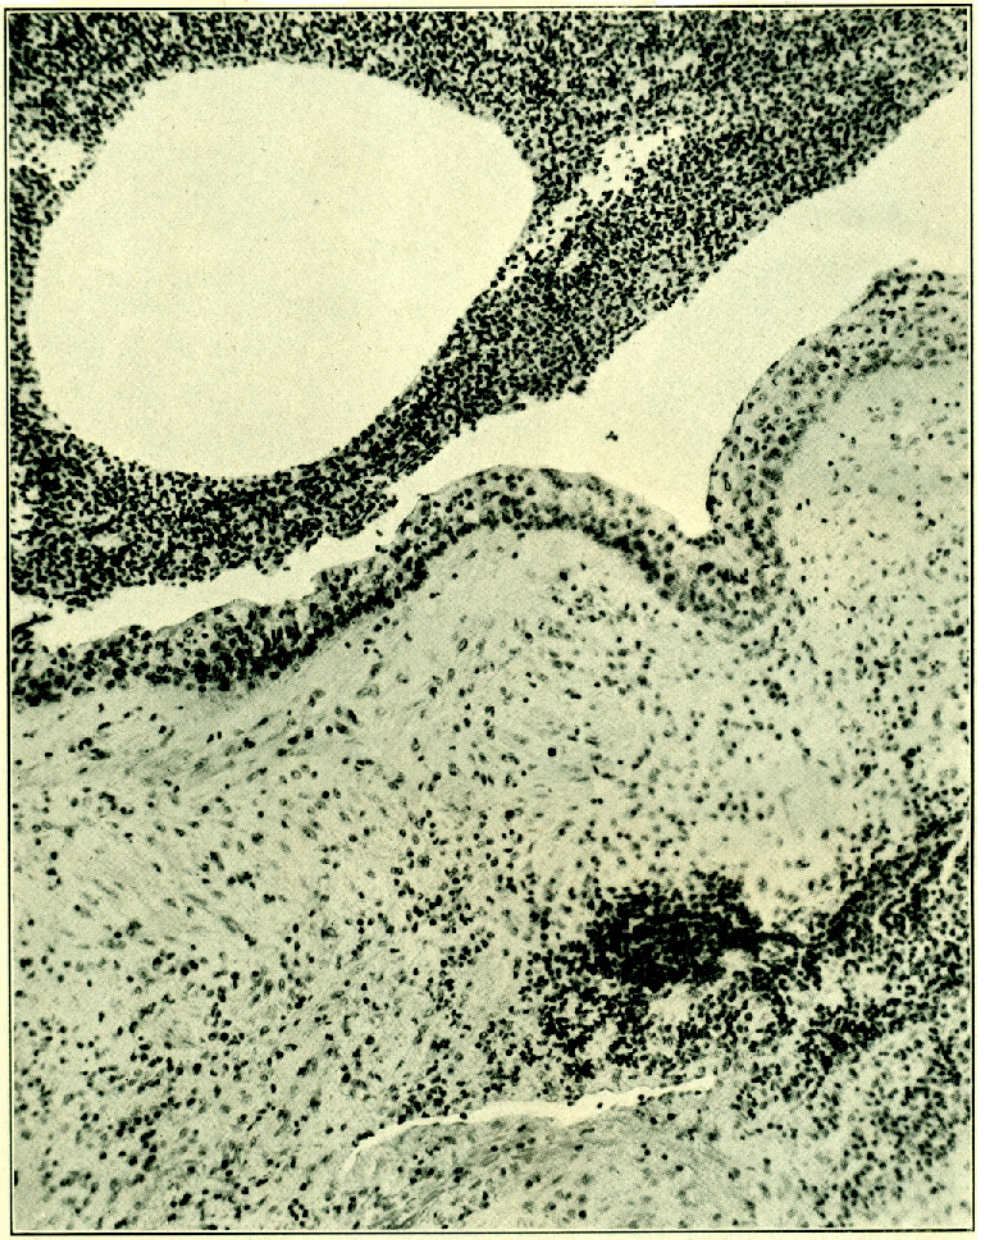

FIG. 50.—Bronchus showing purulent exudate and air in the lumen. Columnar cells are completely desquamated and the basal layers are proliferated, forming an epithelium of the stratified squamous type. This is infiltrated with leucocytes. Surrounding tissues show inflammatory edema and leucocytic infiltration with an increase in lymphocytes in the node which shows at one corner of the figure. This type of reaction occurred early in the influenzal process. Accession number 2694, Army Medical Museum. Negative number 46029. Hematoxylin and eosin stain; × 145
