

FIG. 224.—Protective action of petrolatum when dichlorethylsulphide is applied as “splash,” and when applied through fabric. In experiments No. 10 and No. 11, the alcoholic dichlorethylsulphide was applied directly to the skin; No. 11 was previously vaselined. The protective value of the petrolatum in No. 11 is apparent. In No. 12 and No. 13 the alcoholic dichlorethylsulphide was dropped on a small square of cloth and this was applied to the skin; No. 13 was first oiled with petrolatum. Note that the two lesions are practically alike. The photograph was taken 19 days after the application
