

FIG. 228.—Efficiency of dry powders. Dichlorethylsulphide vapor was applied. Note the normal lesion in the bare skin (26); the slight protection afforded by zinc stearate (30); and the complete protection from kaolin, fuller's earth, and charcoal (indicated by the absence of lesions in a straight line drawn from 26 to 30). The photograph was taken 3 days after the application. (The numbers in parenthesis refer to experiments.)
