

FIG. 258.—Mid section of the arm of the preceding figures showing a beginning putrefactive gangrene around the lower third of the humerus, with some accumulation of gas bubbles in the muscles above this area. There is a fibrinous exudate around the fracture which extends into the marrow of both fragments. The muscles around this point show lack of texture and color typical of the toxic or edematous type of gas gangrene. Accession number 2891, Army Medical Museum. Negative number 32372
