

FIG. 109. —Early stage of consolidation in a lobular pneumonia which was grossly hemorrhagic in type. Cultures from the lung showed both hemolytic streptococci and pneumococci. In this section pneumococcus forms were numerous in the exudate and alveoli. A few Gram-negative bacilli were seen along the walls of the atrium, which appears at the lower part of the picture. In this structure there is a beginning formation of hyalin membrane. Accession number 3108, Army Medical Museum. Negative number 45165. Hematoxylin and eosin stain;  $\times 650$
