

FIG. 225.—From a cross section of a cable-auto-nerve transplant, Experiment No. 75, 26 days after operation; pyridine-silver preparation. The figure presents a portion of one of the larger funiculi of a transplanted nerve segment as seen in Figure 222. The black dots represent cross sections of a single neuraxis or small bundles of such which get through the central wound and into the neurolemma sheaths of the transplanted nerves
