

FIG. 23.—From a longitudinal section of the central third of a cable-into-nerve transplant, Experiment No. 15, 26 days after operation. The figure presents a portion of one of the larger funiculi as seen in longitudinal section. Note the regular mass of down-growing neurites, indicating that they are extending distally within the neurilemma sheaths of the transplanted nerves. (Compare with fig. 224)
